### Summary

This report comprises Moody's twenty-fourth annual default study in which we update statistics on the default, loss, and rating transition experience of corporate bond and loan issuers for 2010, as well as for the historical period since 1920. This study covers financial institutions, non-financial corporates, and regulated utilities which have long-term debt ratings. Briefly, we find that:

- » 57 Moody's-rated corporate issuers defaulted on a total of \$25.1 billion of bonds and \$14.0 billion of loans in 2010. Including issuers whose ratings were withdrawn prior to January 1, 2010 or newly rated in 2010, 61 corporate issuers defaulted on \$26.1 billion of bonds and \$15.0 billion of loans.
- » 2010's defaults were found in a variety of industries led by the Capital Industries and the Consumer Industries sectors, which saw thirteen and ten defaults, respectively. Across regions, defaults remained concentrated in North America with 45 issuers defaulting on \$23.4 billion of debt. In comparison, eight Moody's-rated corporate issuers defaulted on \$9.0 billion of debt in Europe. The remaining defaulters were Latin-American and Asian issuers.
- » Moody's global speculative-grade default rate ended 2010 at 3.2%, noticeably down from 2009's year-end level of 13.1%. The default rate for all Moody's-rated corporate issuers fell to 1.3% at the end of 2010 from 5.4% at year-end 2009. Both results correspond quite closely with our one-year-ago forecasts of 3.3% and 1.4%, respectively.
- » Measured on a dollar volume basis, Moody's global speculative-grade bond default rate ended 2010 at 1.6%, down from 16.8% at the end of 2009. Among all Moody's-rated issuers, the volume-weighted default rate dropped from 2.8% in 2009 to 0.3% in 2010.
- » Moody's global speculative-grade default rate forecasting model now predicts that the speculative-grade default rate will decline gradually to 1.4% by the fourth quarter of 2011, a level significantly below the long term average of 5% since 1983.
- » The quarterly downgrade-to-upgrade ratio declined to 1.1% in the second quarter of 2010, the lowest quarterly level in the past three years. The ratio finished the fourth quarter at 1.2%.
- » Measured by post-default trading prices, the average recovery rate for senior unsecured bonds rose to 49.5% in 2010 from 37.1% in 2009.

## Introduction

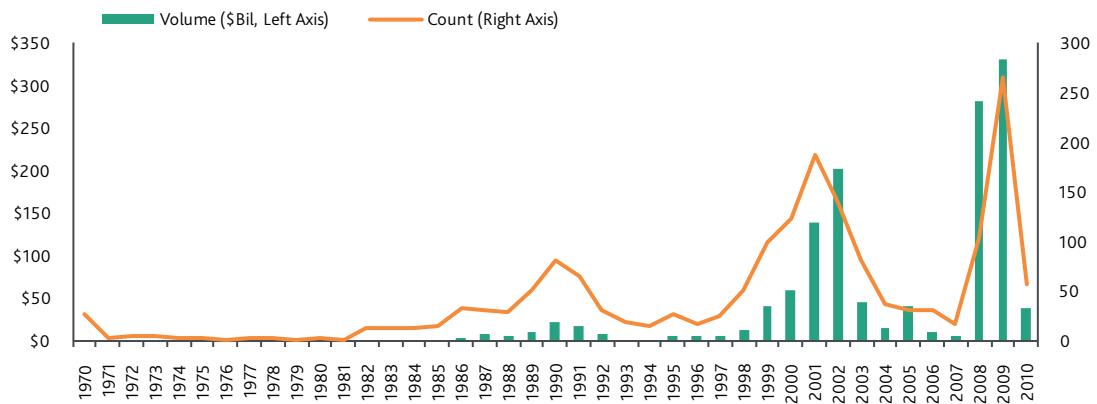

Moody's credit ratings facilitate the efficient functioning of capital markets by providing independent opinions on the creditworthiness of debt obligations issued by corporate issuers around the world. One of the primary purposes of Moody's corporate default study is to communicate the historical performance of Moody's ratings as predictors of default and loss severity for corporate issuers. In addition to providing useful data for investors and regulators, Moody's default studies also contribute to the transparency of the rating process and directly address the meaning of Moody's long-term debt ratings scale.

In this study, we first summarize corporate default experience and credit trends in 2010 and then discuss Moody's forecast for speculative-grade corporate default rates in 2011.<sup>1</sup> This is followed by a review of 2010 rating accuracy metrics and the historical statistics on corporate defaults, ratings transitions, ratings performance metrics, and recovery rates. Finally, this report also includes several detailed sections describing the methodologies used to generate the statistics as well as a guide to their reading and interpretation.

## Defaults Slowed Down Considerably in 2010

2010 was a good year for the high yield debt market with respect to above-average returns and below-average defaults. Indeed, defaults dropped significantly last year mainly due to ample liquidity which helped some lowly rated companies avoid default. World-wide, only 57 Moody's-rated corporate issuers defaulted on a total of \$39.1 billion of debt in 2010,<sup>2</sup> the lowest record in the past three years. In comparison, 265 companies defaulted on a total of \$330.0 billion of debt in 2009 while 103 defaults were registered in 2008, affecting \$280.9 billion of debt. From a geographic standpoint, defaults remained concentrated in North America with 45 issuers defaulting in 2010. Meanwhile, only eight defaults were recorded in Europe, the second largest region for defaults. On a volume basis, defaulted debt totaled \$23.4 billion in North America compared to \$9.0 billion in Europe. Exhibit 1 presents annual default counts and defaulted debt volumes for the period of 1970-2010.

**EXHIBIT 1**  
**Default Count and Volume Off Their Unprecedented Levels**

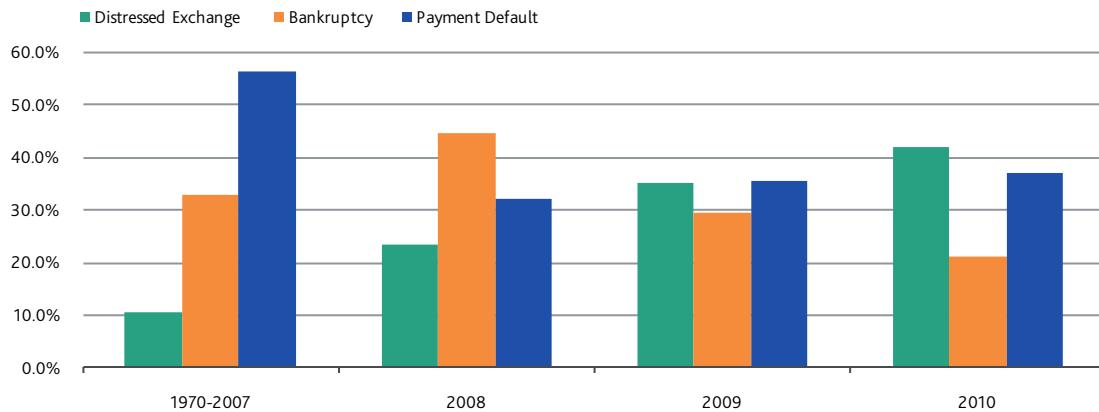

<sup>1</sup> The analysis of default and rating transitions in this report is limited to Moody's-rated financial and non-financial corporate issuers, including utility companies. Consistent with prior year studies, this report's default and transition rate statistics only cover issuers that have Moody's-rated bonds and/or loans and default refers to debt default as defined on page 61. Unless otherwise specified, ratings in this report are issuer level, senior unsecured equivalent ratings which are derived from [Moody's Senior Rating Algorithm](#). For more details, please see the Methodology and Data Sources section at the end of this report.

<sup>2</sup> Including companies whose ratings were withdrawn prior to January 1, 2010 or were newly rated sometime in 2010, a total of 61 companies defaulted in 2010 with \$41.1 billion of debt impacted.

Similar to what we observed in 2008 and 2009, distressed exchanges still played an active role in 2010, accounting for 42% of total initial defaults. To put this in context, distressed exchanges only accounted for approximately 11% of initial defaults on average from 1970 to 2007. Several factors accelerated the pace of distressed exchanges in this cycle including the inability of some speculative-grade issuers to access the debt markets and the unattractiveness of bankruptcy given a lack of DIP and exit financing. Between 2008 and 2010, the share of distressed exchanges increased from 23% to 42% while the share of bankruptcy filings fell from 45% to 21% (see Exhibit 2).

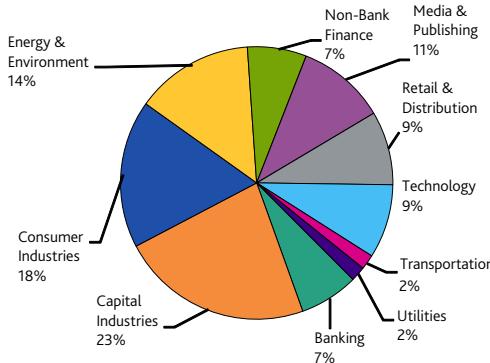

**EXHIBIT 2**  
**Distressed Exchanges Remained Active**

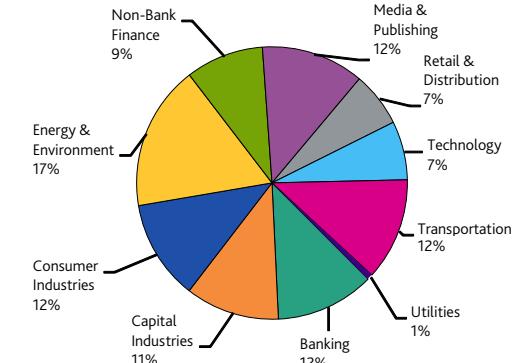

Of the 57 defaults in 2010, almost 23% were by issuers in the Capital Industries sector,<sup>3</sup> among which defaults were most notable in the Capital Equipment industry. Issuers in the Consumer Industries sector accounted for the next highest share of 2010 defaults with 18%. Measured by default volume, however, the Energy & Environment sector topped the list by contributing 17% of defaulted volume, followed by the Transportation, the Consumer Industries, the Banking, and the Media & Publishing sectors, each accounting for 12% of total default volume in 2010. Exhibit 3 shows the distribution of 2010 defaults by broad industries.

**EXHIBIT 3**  
**2010 Defaults by Broad Industry**

**Panel A Percent of Issuer Counts**

**Panel B Percent of Dollar Volume**

<sup>3</sup> Capital industries sector includes automotive, capital equipment, chemicals, plastics & rubber, construction & building, containers, packaging, & glass, forest products & paper, metals & mining, and business service industries. Consumer industries sector includes beverage, food, & tobacco, durable & non-durable consumer goods, healthcare & pharmaceuticals, hotel, gaming, & leisure, and consumer service industries.

Although the Capital Industries sector accounted for 23% of defaults last year, it was not the sector with the highest rate of default. That distinction belongs to the Media & Publishing industry, which had a 3.6% default rate in 2010 (see Exhibit 4).

---

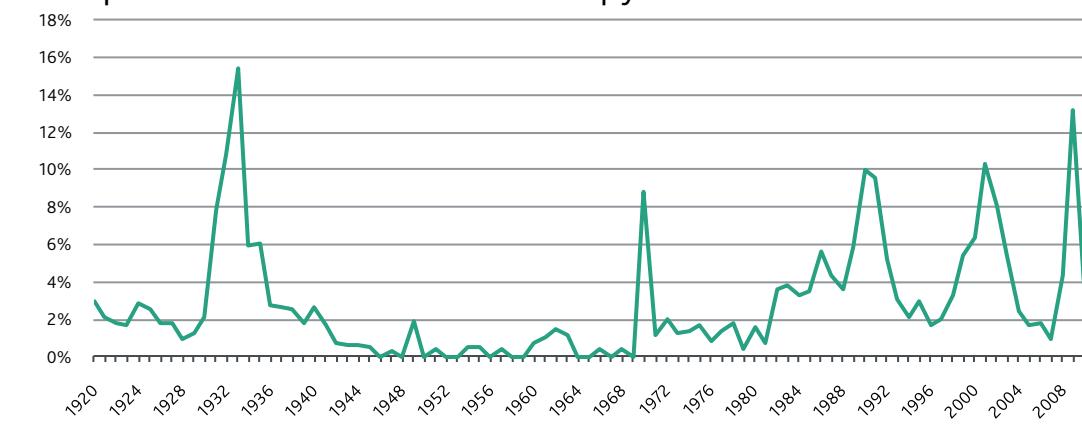

**EXHIBIT 4**
**Default Rate Highest in the Media & Publishing Sector**

| Broad Industry        | Default Rates* |
|-----------------------|----------------|
| Banking               | 0.5%           |
| Capital Industries    | 1.6%           |
| Consumer Industries   | 1.9%           |
| Energy & Environment  | 2.3%           |
| Non-Bank Finance      | 0.8%           |
| Media & Publishing    | 3.6%           |
| Retail & Distribution | 3.3%           |
| Technology            | 1.3%           |
| Transportation        | 0.9%           |
| Utilities             | 0.2%           |

\* Issuer-weighted

As a result of the rapid decrease in defaults, the trailing twelve-month issuer-weighted default rate for all Moody's-rated issuers fell sharply to 1.3% in 2010 from 5.4% in 2009. Among speculative-grade issuers, the default rate dropped to 3.2% from 13.1% (see Exhibit 5). Measured on a dollar volume basis, Moody's speculative-grade corporate bond default rate declined more dramatically to 1.6% in 2010 from 16.8% in 2009. And the volume-weighted default rate for all Moody's-rated issuers ended 2010 at 0.3%, down from 2009's 2.8%.

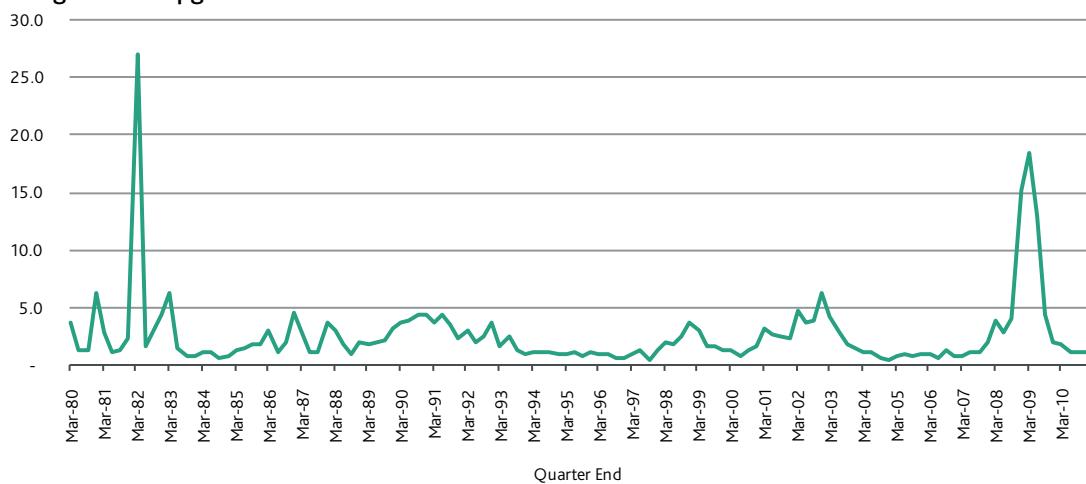

---

**EXHIBIT 5**
**Global Speculative-Grade Default Rate Declined Sharply in 2010**

Consistent with gradually recovering credit quality and decreasing numbers of defaults, the quarterly downgrade-to-upgrade ratio for corporate issuers fell in 2010 resulting from both reduced numbers of downgrades and increased numbers of upgrades. The most noticeable improvement in credit quality was found in the second quarter of the year when the downgrade-to-upgrade ratio declined from 1.8

to 1.1.<sup>4</sup> The ratio then stabilized in the following two quarters and ended the year at 1.2, indicating that the number of rating downgrades was slightly higher than upgrades. For historical perspective, Exhibit 6 draws the quarterly downgrade-to-upgrade ratio for Moody's-rated corporate issuers since 1980.

EXHIBIT 6

**Downgrade-to-Upgrade Ratio Back to Normal**

Historically, as shown by Moody's research, default rates and recovery rates are negatively correlated. In 2010, with default rates decreasing sharply, the inverse relationship between default rates and recovery rates was confirmed again as recovery rates for first lien loans and most bonds were noticeably higher than the comparable numbers in 2009 and the long-run historical averages as shown in Exhibit 7.

EXHIBIT 7

**Average Corporate Debt Recovery Rates Measured by Post-Default Trading Prices**

| Lien Position           | Issuer-weighted |       |           | Value-weighted |       |           |
|-------------------------|-----------------|-------|-----------|----------------|-------|-----------|
|                         | 2010            | 2009  | 1982-2010 | 2010           | 2009  | 1982-2010 |
| 1st Lien Bank Loan      | 70.9%           | 53.6% | 65.8%     | 72.3%          | 56.3% | 59.6%     |
| 2nd Lien Bank Loan      | 18.2%           | 16.0% | 29.1%     | 18.4%          | 20.8% | 27.9%     |
| Sr. Unsecured Bank Loan | n.a.            | 32.6% | 47.8%     | n.a.           | 37.9% | 39.9%     |
| Sr. Secured Bond        | 62.5%           | 37.5% | 50.8%     | 54.7%          | 29.6% | 49.1%     |
| Sr. Unsecured Bond      | 49.5%           | 37.1% | 36.7%     | 63.8%          | 35.5% | 37.4%     |
| Sr. Subordinated Bond   | 33.5%           | 22.4% | 30.7%     | 39.4%          | 18.0% | 25.3%     |
| Subordinated Bond*      | 33.7%           | 45.3% | 31.3%     | 32.2%          | 25.1% | 24.2%     |
| Jr. Subordinated Bond   | n.a.            | n.a.  | 24.7%     | n.a.           | n.a.  | 17.1%     |

\* The recovery rate for 2010's subordinated bonds were based on four observations.

Among various default events, recovery rates generally tend to be higher on distressed exchanges as opposed to other types of default. As shown in Exhibit 8, this phenomenon held true in 2010 as

<sup>4</sup> We only include rating actions which result from a change in credit quality. Rating changes stemming from methodology changes (e.g. JDA, LGD) are not counted.

recovery rates were higher for distressed exchanges across all debt types. For example, the average senior unsecured bond recovery rate was 62.2% for distressed exchanges, compared to 40.7% for bankruptcy and payment defaults. The table also shows that the gap in recovery rates was smaller in first lien loans but larger for bonds. This stems from the fact that a majority of distressed exchanges only involve junior debt in the capital structure. As distressed exchanges accounted for a significant share of all defaults in 2010, they also contributed to the relatively high numbers reported in Exhibit 7.

## EXHIBIT 8

**2010 Recovery Rates: Distressed Exchanges vs. Non-Distressed Exchanges**

| Lien Position         | Distressed Exchange Defaults | Bankruptcies & Payment Defaults |
|-----------------------|------------------------------|---------------------------------|
| 1st Lien Bank Loan    | 74.8%                        | 70.2%                           |
| 2nd Lien Bank Loan    | 24.5%                        | 15.7%                           |
| Sr. Secured Bond      | 87.2%                        | 57.5%                           |
| Sr. Unsecured Bond    | 62.2%                        | 40.7%                           |
| Sr. Subordinated Bond | 60.0%                        | 30.2%                           |
| Subordinated Bond     | 33.7%                        | n.a.                            |

The recovery data discussed above are based on debt trading prices 30 days after the default date. An alternative recovery measure is based on ultimate recoveries, or the value creditors realize at the resolution of a default event. For example, for issuers filing for bankruptcy, the ultimate recovery is the present value of the cash and/or securities that the creditors actually receive when the issuer exits bankruptcy, typically 1-2 years following the initial default date.<sup>5</sup>

In Exhibit 9, we present data on ultimate recovery rates for North American companies included in Moody's Ultimate Recovery Database (URD).<sup>6</sup> In 2010, the URD has been expanded to include the ultimate resolutions for more than 950 default events. The average "firm-wide" recovery rate<sup>7</sup> for the 49 default resolutions in 2010 was 62.5% compared to 56.2% for the 74 default resolutions in 2009. Recent higher recovery rates can be attributed to the greater amount of distressed exchanges used as a method of debt reduction. As shown in Exhibit 9, 2010's recovery rates across debt classes were broadly similar to those in 2009 as well as their historical averages. For example, loans recovered 78.6% in 2010 as compared to 77.1% in 2009 while senior unsecured bonds recovered 51.0% in 2010 versus 48.3% in 2009.

<sup>5</sup> For details, see Moody's Special Comment "[Moody's Ultimate Recovery Database](#)," April 2007.

<sup>6</sup> The analysis on ultimate recovery is provided by David Keisman and Randy Lampert. The data is from Moody's Ultimate Recovery Database which includes robust detailed recovery information for over 4,500 loans and bonds from more than 950 North American non-financial corporate defaulters since 1987.

<sup>7</sup> For a given issuer, the firm-wide recovery rate is the weighted-average recovery rate across all of the issuer's debts where the weights are the size of the debts. Or in other words, it is the enterprise value of the issuer divided by the firm's total debts at the time of resolution.

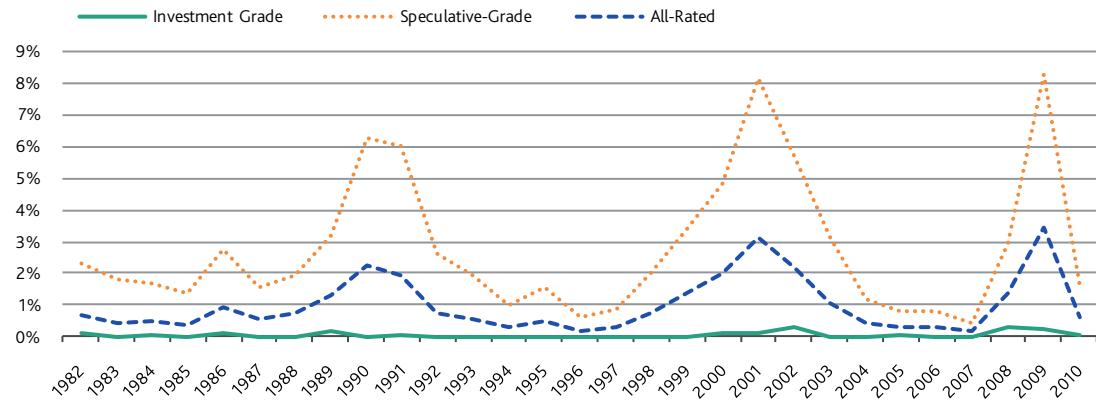

## EXHIBIT 9

**Average Corporate Debt Recovery Rates Measured by Ultimate Recoveries, 1987-2010**

| Lien Position    | Emergence Year |       |           | Default Year <sup>8</sup> |       |           |
|------------------|----------------|-------|-----------|---------------------------|-------|-----------|
|                  | 2010           | 2009  | 1987-2010 | 2010                      | 2009  | 1987-2010 |
| Loans            | 78.6%          | 77.1% | 80.3%     | 80.2%                     | 78.9% | 80.3%     |
| Bonds            |                |       |           |                           |       |           |
| Sr. Secured      | 64.4%          | 59.0% | 63.5%     | 56.3%                     | 65.6% | 63.5%     |
| Sr. Unsecured    | 51.0%          | 48.3% | 49.2%     | 26.5%                     | 51.6% | 49.2%     |
| Sr. Subordinated | 20.5%          | 26.2% | 29.4%     | 21.7%                     | 28.0% | 29.4%     |
| Subordinated     | 53.4%          | 34.3% | 29.3%     | 0.0%                      | 58.3% | 29.3%     |
| Jr. Subordinated | n.a.           | 0.5%  | 18.4%     | n.a.                      | 0.0%  | 18.4%     |

Moody's credit ratings are opinions of relative expected credit losses, which are a function of both the probability of default and severity of default (LGD). Exhibit 10 shows annual average credit loss rates from 1982 through 2010 for Moody's-rated corporate issuers. With the default rate falling and loss severity (i.e. 1-recovery rate) decreasing, the average credit loss rate among all Moody's-rated issuers dropped to 0.6% in 2010 from 3.4% in 2009. To put this in perspective, the average annual credit loss rate for Moody's-rated issuers since 1982 is 1.0%.

## EXHIBIT 10

**Credit Loss Rates Fell Considerably in 2010****Default Rate Outlook for 2011**

At the beginning of 2010, reflecting the decline in the high yield bonds spreads, Moody's default rate forecasting model (Credit Transition Model or CTM) predicted that the global speculative-grade

<sup>8</sup> Please note that the ultimate recovery rates only apply to companies who have emerged from defaults. Therefore, some of the 2009 and 2010 defaults are not included in the ultimate recovery data under the Default Year panel if such defaults have not yet been resolved. These observations will be added when their resolution is concluded.

default rate would fall sharply to 3.3% by the end of the year. The model's prediction turned out to be quite accurate as the realized rate came in at 3.2%, just slightly below CTM's forecast.<sup>9</sup>

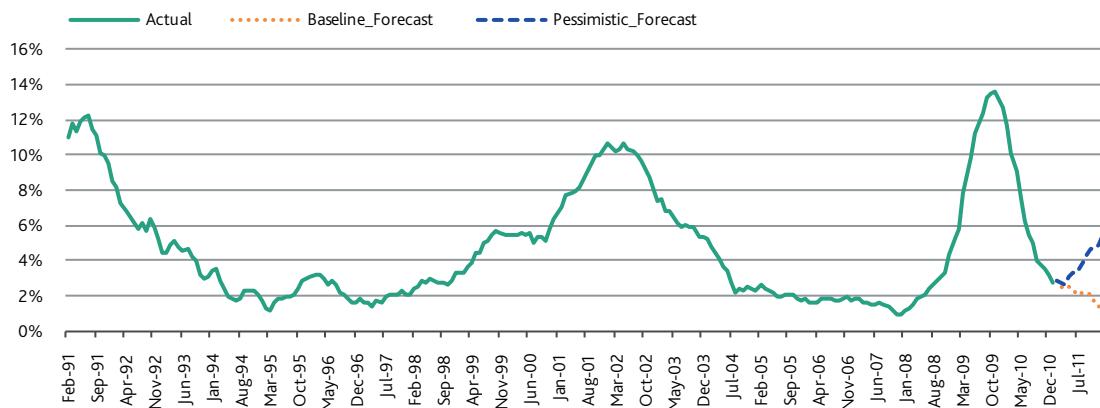

Looking into 2011, CTM forecasts that the global speculative-grade default rate will continue to slide this year. The downward pressure can be attributed to improved fundamentals (as reflected in improved ratings, momentum, and credit outlooks) as well as our expectations of stable economic conditions including further tightening in the high yield spread. This forecast is consistent with the declining number of distressed issuers as evidenced in Moody's Distressed Index and the reduced number of companies with the weakest Speculative-Grade Liquidity Rating as reflected in Moody's Liquidity-Stress Index (LSI). Generally speaking, LSI declines when corporate liquidity improves, and that signals a lower default rate in the near future.<sup>10</sup>

Based on the model's projection, the global speculative-grade default rate is expected to fall from 3.2% in 2010 to 1.4% in 2011, under the baseline scenario (see Exhibit 11). This forecast implies approximately 28 total defaults globally in 2011. Compared to 2010, the default rate is expected to decline more gradually in 2011 and may stabilize towards the end of the year.

The baseline forecast assumes that the unemployment rate will ease from its current level of 9.7% to 8.9% by the fourth quarter of 2011 and that the high yield spread will decline from 540 bps to 365 bps. Under a more pessimistic macroeconomic scenario, where the unemployment rate climbs to 13.4% and the high yield bond spread increases to 890 basis points, the global speculative-grade default rate is forecasted to rebound to 4.9% by the end of 2011.

---

**EXHIBIT 11**  
**Speculative-Grade Default Rate Expected to Remain Low in 2011**

For U.S. and European speculative-grade issuers, Moody's forecasting model projects default rates dropping to 1.6% and 1.0%, respectively, by the end of 2011 under the baseline scenario. Across industries over the coming year, default rates are expected to be highest in the Consumer Transportation sector in the U.S. and the Media: Advertising, Printing & Publishing sector in Europe. Exhibit 12 shows the baseline one-year default rate forecasts across industries in both the U.S. and Europe, sorted from highest to lowest by the U.S. rates.

<sup>9</sup> For a thorough review of our forecast performance in 2010, please see "[Evaluating Moody's Corporate Default Forecasts for 2010](#)," Moody's Special Comment, February 2011.

### Rating Accuracy Metrics

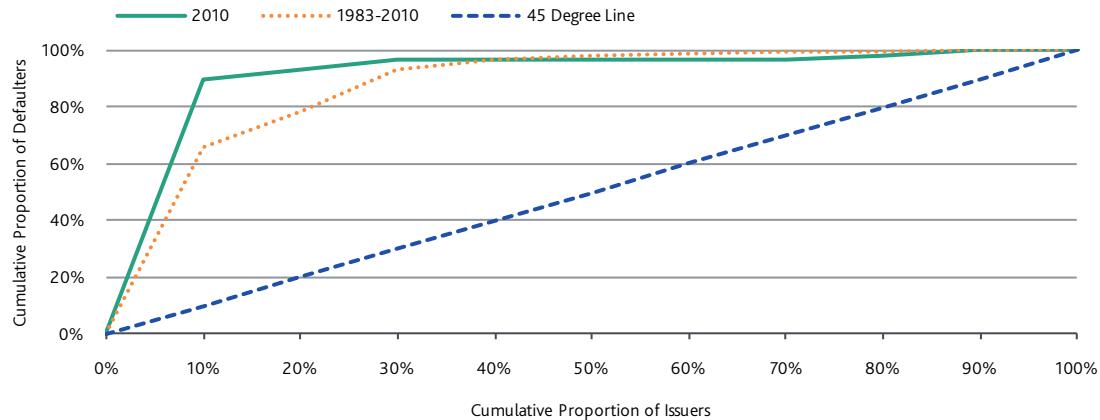

Moody's ratings have historically proven to be effective predictors of default. This can be seen in Exhibit 13, which plots the median ratings of roughly 1,700 corporate issuers that defaulted from 1983 to 2010. The chart shows that, historically, Moody's-rated issuers have been downgraded to the B1 level as early as five years prior to default. The comparable rating was B3 among issuers that defaulted in 2010. At one year prior to default, 2010 defaulters' ratings were lowered to Caa2, also below the B3 rating for companies that defaulted during the entire period of 1983-2010.

**EXHIBIT 13**  
**Median Ratings Prior to Default**

As a valuable tool to measure credit risk, ratings are expected to differentiate strong credits from weaker ones. In other words, an effective rating system should not only assign low ratings to issuers that ultimately default but also assign high ratings to those that are remote from default. A metric designed to measure this aspect of ratings performance is the cumulative accuracy profile (CAP) plot as shown in Exhibit 14. A rating system that possessed no predictive information about default risk would lie on the  $45^\circ$  line; the further the CAP curve bows toward the northwest corner, the better it is at identifying defaults in the riskiest rating categories. Exhibit 14 shows that the CAP curve for 2010 bows towards the northwest corner more than the one for the 1983-2010 period, which suggests that the rating performance in 2010 is better than the historical average.

**EXHIBIT 14**  
**One Year Cumulative Accuracy Plots, 2010 vs. Historical Average**

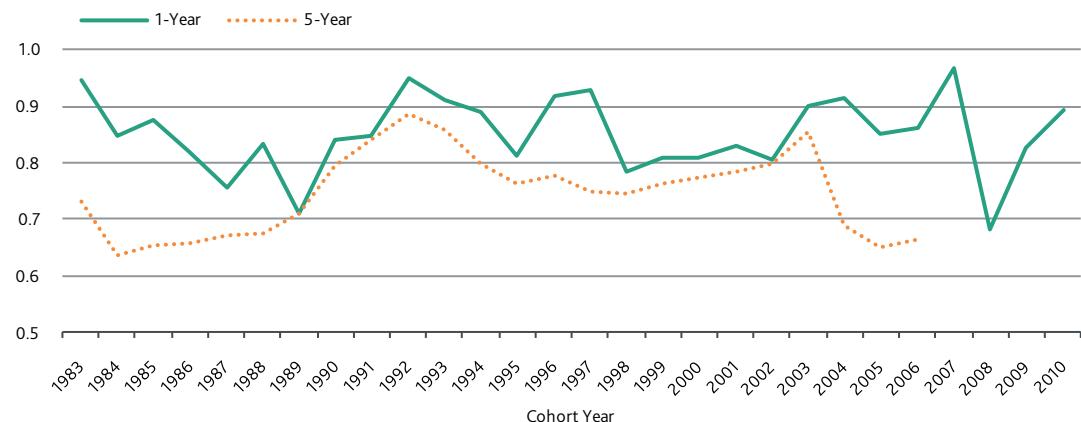

Another way to measure rating performance is the accuracy ratio, which is derived from the CAP curve. The accuracy ratio (AR) is the ratio of the area between the CAP curve and the  $45^\circ$  line to the maximum possible area above the  $45^\circ$  line, divided by survival rate (i.e. 1-default rate).<sup>11, 12</sup> AR values range from minus one to positive one and a higher AR indicates better rating accuracy. Exhibit 15 presents the one- and five-year horizon accuracy ratios for the period of 1983-2010. The chart shows that while the five-year ratio remains below the average level since 1983, the one-year ratio has recovered quickly from its 2008 cyclical low. The graph further suggests that the one-year accuracy ratio is positively correlated with the credit cycle: when defaults increase, the accuracy ratio falls. At the five-year horizon, this correlation is much less evident.

<sup>11</sup> Accuracy Ratio is defined in "[Benchmarking Quantitative Default Risk Models: A Validation Methodology](#)" (2000). The Accuracy Ratios from those reports published prior to 2010 were defined as the ratio between the CAP curve and the 45 degree line to the maximum possible area above the 45 degree line. In other words, the new AR equals the old AR divided by the survival rate (i.e., 1- default rate) for the cohort under consideration. The adjustment was made for the purposing of allowing Accuracy Ratios to be 100% when defaulters are perfectly differentiated from non-defaulters.

<sup>12</sup> The Accuracy Ratio is also equivalent to the Average Default Position, an arguably more intuitive measure of ordinal accuracy. See "[Measuring Ratings Accuracy Using the Average Default Position](#)," Moody's Special Comment, February 2011.

<sup>1</sup> Default volume in millions of USD<sup>2</sup> Only issuers included in the January 1 cohort are included in Moody's default rates

3 Default amount not publicly available

4 These companies failed to make payments on debts that they guaranteed. Guaranteed debts are only added to the issuers but not to the guarantors in order to avoid double counting

## Guide to Data Tables and Charts

In this section we briefly describe the interpretation of some of the Exhibits contained in this report. Methodological details are discussed in separate sections below.

Exhibit 13 was derived by mapping Moody's ratings to a linear scale, then taking the median values of the numerically mapped ratings.

Exhibit 22 shows average senior unsecured recovery rates by letter rating and year prior to default. Each cell in the table indicates the average recovery rate on senior unsecured bonds with a specific rating within  $T$  years of default. For example, the 36.06% two-year B recovery rate reported in Exhibit 22 indicates the average recovery rate on B rated issues that default at some time within a two-year period, not recovery rate for issuers rated B *exactly* two years before default.<sup>13</sup> Together with issuer-weighted average cumulative default rates, these multi-period recovery estimates are used to calculate cumulative expected credit loss rates, as presented in Exhibit 23.

Exhibits 33 through 37 show issuer-weighted historical average default rates by rating category over various investment horizons. These data were generated by averaging the multi-year default rates of cohorts formed at monthly intervals. In addition to their being statements of historical fact, these data are also useful proxies for *expected* default rates. For example, over a five-year period a portfolio of B-rated issuers defaulted at a 26.5% average rate between 1983 and 2010 (see Exhibit 35). For an investor with a five-year exposure to a B-rated debt obligation or counterparty, this estimate also happens to be the best estimate of the expected risk of default for a B-rated exposure based on the available historical data, particularly over long investment horizons.

Exhibit 41 shows average cumulative volume-weighted default rates by rating category. Whereas issuer-based default rates weight each issuer equally, these data weight each issuer by the total volume of defaulted debt; larger defaults receive relatively more weight. Average default rates based on debt volume affected are less suitable estimates of expected default risk. One reason is that issuer default volumes vary considerably over time. On average, a leveraged corporate issuer defaults on approximately \$300 million of bonds. However, that total has been as high as \$30 billion (WorldCom). Issuer-based default rates receive particular emphasis in the rating process because the expected likelihood of default of a debt issuer holding a given rating is expected to be the same regardless of differences in the nominal sizes of the exposures.

Exhibit 42 shows the cumulative issuer-weighted historical default rates of cohorts formed at annual intervals between the years 1970 and 2010 (January 1 of each year). These data are a subset of the data used to calculate the issuer-weighted averages shown in Exhibits 34 (which, again, are based on cohorts formed at monthly time intervals). The default rates in Exhibit 42 may be useful for scenario analysis. For example, if one believed that future default rates for a given pool of issuers will behave as they did in, say, 1997, then one can use the January 1, 1997 cohort cumulative default rates as proxies for expected default rates.

<sup>13</sup> The details of the calculation may be found in Moody's Special Comment, "[Recovery Rates on Defaulted Bonds and Preferred Stocks](#)", December 2003.

## Methodology and Data Sources

### Moody's Definition of Default

Moody's definition of default is applicable only to debt or debt-like obligations (e.g., swap agreements). Four events constitute a debt default under Moody's definition:

- a) a missed or delayed disbursement of a contractually-obligated interest or principal payment (excluding missed payments cured within a contractually allowed grace period), as defined in credit agreements and indentures;
- b) a bankruptcy filing or legal receivership by the debt issuer or obligor that will likely cause a miss or delay in future contractually-obligated debt service payments;
- c) a distressed exchange whereby 1) an obligor offers creditors a new or restructured debt, or a new package of securities, cash or assets that amount to a diminished financial obligation relative to the original obligation and 2) the exchange has the effect of allowing the obligor to avoid a bankruptcy or payment default in the future; or
- d) a change in the payment terms of a credit agreement or indenture imposed by the sovereign that results in a diminished financial obligation, such as a forced currency re-denomination (imposed by the debtor himself, or his sovereign) or a forced change in some other aspect of the original promise, such as indexation or maturity.<sup>14</sup>

Moody's definition of default does not include so-called "technical defaults," such as maximum leverage or minimum debt coverage violations, unless the obligor fails to cure the violation and fails to honor the resulting debt acceleration which may be required. Also excluded are payments owed on long-term debt obligations which are missed due to purely technical or administrative errors which are 1) not related to the ability or willingness to make the payments and 2) are cured in very short order (typically, 1-2 business days).

### Rating Migration Calculations

A rating migration matrix completely summarizes changes in credit ratings over a given time horizon. The cells of the matrix are discrete-time estimates of rating migration probabilities. They show rate of rating change measured at two points in time; e.g. the start and end of one year. When calculating credit rating migration rates, Moody's treats rating changes, rating withdrawals, and defaults as mutually exclusive states. For example, an issuer that is downgraded on the day of default is counted only as a default, not a downgrade or a downgrade and default. Similarly, an issuer whose rating is withdrawn on the day of default is counted as a default, not a withdrawal.

The probability that an issuer's rating  $i$  held on cohort date  $y$  will transition to rating  $j$  (which includes default and withdrawal) over a time horizon  $T$  is calculated as:

---

<sup>14</sup> Moreover, unlike a general tax on financial wealth, the imposition of a tax by a sovereign on the coupon or principal payment on a specific class of government debt instruments (even if retroactive) would represent a default. Targeted taxation on government securities would represent a default even if the government's action were motivated by fairness or other considerations, rather than inability or unwillingness to pay.

$$p_{ij}^y(T) = \frac{n_{ij}^y(T)}{n_i^y(0)}$$

The weighted average rating migration rate for all cohorts y in the historical data set Y is calculated as:

$$\bar{p}_{ij}(T) = \frac{\sum_{y \in Y} n_{ij}^y(T)}{\sum_{y \in Y} n_i^y(0)}$$

### Default Rate Calculation

Moody's method for calculating cumulative default rates is a discrete-time approximation of the nonparametric continuous-time hazard rate approach.<sup>15</sup> Cumulative default rates are calculated from marginal default rates, which represent the probability that an issuer that has survived in the sample through a particular date will default over the next time interval (typically, one year) following that date.

The marginal default rate for issuers holding rating i on cohort date y is the ratio of the number of defaulting issuers in period t divided by the number of issuers exposed to the risk of default in period t:

$$d_i^y(t) = \frac{x_i^y(t)}{n_i^y(t) - x_i^y(t-1) - \frac{1}{2}[w_i^y(t) + w_i^y(t-1)]}$$

The denominator of the marginal default rate adjusts for defaults that occur prior to time interval t, as well as rating withdrawals, w(t), that occur in periods prior to interval t and a small adjustment for withdrawals that occur in time interval t. Cumulative default rates for investment horizons of length T, D(T), are built up from the marginal default rates:

$$D_i^y(T) = 1 - \prod_{t=1}^T [1 - d_i^y(t)]$$

Or, expanding the above equation (and dropping indices for brevity):

$$D(T) = d(1) + d(2)[1 - d(1)] + d(3)[(1 - d(1))(1 - d(2))] + \dots + d(T)\left(\prod_{t=1}^{T-1} [1 - d(t)]\right)$$

In the first time period, a fraction of the credit exposures in the cohort either defaults or survives. The credit exposures that survive period one may then go on to default or survive in period two; those that survive period two may go on to default or survive in period three, etc. Because the time periods are non-overlapping and the probability of default in each period is assumed to be independent, the T-period cumulative default rate is defined as one minus the product of the T marginal survival rates.

<sup>15</sup> See Moody's Global Credit Research "[Measuring Corporate Default Rates](#)", November 2006

The calculation of the average cumulative default rate for rating class i,  $\bar{D}_i(T)$ , is derived from the weighted average marginal default rates,  $\bar{d}_i(t)$ , calculated from all the available cohort marginal default rates in the historical data set Y:

$$\bar{D}_i(T) = 1 - \prod_{t=1}^T [1 - \bar{d}_i(t)]$$

where

$$\bar{d}_i(t) = \frac{\sum_{y \in Y} x_i^y(t)}{\sum_{y \in Y} n_i^y(t)}$$

The default rates calculated in multi-year rating migration matrices are not comparable to those calculated using Moody's discrete-time hazard rate method described above. Rating migration matrices account for rating withdrawals separately (in the column labeled WR) while the hazard rate method incrementally adjusts the denominator of the marginal default rate to remove rating withdrawals. Occasionally, withdrawal-adjusted rating migration matrices are calculated as follows:

$$p_{ij}^y(T)^* = \frac{p_{ij}^y(T)}{(1 - p_{iw}^y(T))}$$

Using this method, all issuers whose ratings are withdrawn are removed. In effect, data for issuers whose ratings are withdrawn is completely discarded. This method generally yields higher default rate estimates than the hazard rate method. Hence, Moody's hazard rate-derived default rate estimates lay between unadjusted migration matrix-derived default rates and withdrawal-adjusted migration matrix-derived default rates.

### Recovery Rate Calculations

Moody's estimates defaulted debt recovery rates using market bid prices observed roughly 30 days after the date of default. Recovery rates are measured as the ratio of price to par value. Using post-default prices to measure recovery (or its complement, loss severity) parallels common practice in the credit default swaps market. Moreover, recovery rates measured in this way are most relevant for cash bond investors who liquidate their holdings shortly after default as often required by their portfolio governance rules or their own investment objectives. For investors holding defaulted securities until ultimate resolution, prices observed shortly after default are generally accepted as the market's estimate of discounted expected ultimate recovery rates.

The alternative approach of directly measuring ultimate realized recoveries presents a number of estimation challenges, including the appropriate discount rate to apply to cash-flows and valuing the assets used to pay creditor claims, which may include illiquid new securities (e.g., equity and derivative instruments) as well as physical assets. The table below defines the various ways Moody's calculates

recovery rates.<sup>16</sup> For the purposes of measuring expected credit loss rates, we rely on issuer-weighted mean recovery rates.

| Statistic                             | Definition  |
|---------------------------------------|---|
| Issuer-Weighted Mean Recovery Rates   | They are derived by estimating mean recovery rates for each issuer, then averaging them across issuers. They are useful for predicting recovery rates for portfolios that are well diversified across issuers.  |
| Value-Weighted Mean Recovery Rates    | They represent the average of recovery rates on all defaulted issuers, weighted by the face value of those issues. These estimates are useful for predicting recovery rates on the market portfolio.  |
| Issuer-Weighted Median Recovery Rates | They are estimated as median of issuer-weighted recovery rates and are used for predicting the most likely recovery rate for a randomly selected issuer.  |
| Issue-Weighted Mean Recovery Rates    | They are estimated using recovery rates for each issue and taking the average of all issues. While this measure is widely reported, it is useful only for predicting the average recovery rate on a portfolio of default bonds diversified across issues but without reference to issuer or issue size. |

### Credit Loss Rate Calculations

Moody's credit ratings are opinions of relative expected credit losses. Credit losses are therefore a function of both probability of default (PD) as well as the severity of default (LGD). The expected credit loss rate for rating category  $i$  is calculated as the product of the T-horizon average issuer-weighted default rate and the T-horizon average issuer-weighted senior unsecured loss severity rate (where  $r(T)$  is the average senior unsecured recovery rate at horizon T):

$$l_i(T) = \bar{D}_i(T) \times (1 - \bar{r}_i(T))$$

### CAP Curve and Accuracy Ratio

In addition to assigning low ratings to issuers that ultimately default, the effectiveness of a rating system depends on its ability to assign high credit ratings to issuers that do not default. In other words, an efficient rating system is able to separate the low credit risks from the high credit risks. A metric designed to measure this aspect of ratings performance is the cumulative accuracy profile (CAP) plot.<sup>17</sup> The CAP plot graphs the cumulative proportion of defaults from a portfolio (the y-axis) against the proportion of issuers exposed to the risk of default (the x-axis), sorted by riskiness. A rating system that randomly identified defaults from non-defaults would plot a line directly on the 45-degree line. The more powerful the discriminatory power of the rating system, the further the CAP curve bows toward the top left corner.

- » CAP curves are powerful tools for visualizing rating performance, but can be unwieldy from making comparisons over many time periods. A summary measure of rating accuracy that can be derived from the CAP curve is the accuracy ratio (AR). The accuracy ratio is the ratio of the area between the CAP curve and the 45-degree line to the total area above the 45-degree line divided by survival rate (i.e. 1-default rate). A rating system that perfectly differentiates defaults from non-

<sup>16</sup> This table is derived from Moody's Special Comment "[Recovery Rates on Defaulted Bonds and Preferred Stocks](#)", December 2003

<sup>17</sup> For a more detailed discussion of rating accuracy metrics see Moody's Global Credit Research "[Measuring the Performance of Corporate Bond Ratings](#)", November 2006

defaults would score an AR of 100%, while a rating system that had zero predictive ability would score 50%.<sup>18</sup>

---

### Data Sources

Moody's bases the results of this study on its proprietary database of ratings and defaults for both financial and non-financial corporate bond and/or loan issuers. Sovereign and sub-sovereign debt issuers, structured finance securities, private placements, and issuers with only short-term debt ratings are excluded unless otherwise noted. In total, Moody's data covers the credit experiences of approximately 20,000 corporate issuers that sold long-term public debt at some time between 1920 and 2010. As of January 1, 2010 roughly 5,000 corporate issuers held a Moody's long-term bond, loan, or corporate family rating.

Moody's database of corporate defaults covers approximately 5,000 long-term debt defaults by issuers both rated and non-rated by Moody's. Additional data sources, such as Barclay Fixed Income Index data, supplemented Moody's proprietary data in the construction of the aggregate dollar volume-weighted default rates. Defaulted debt pricing data was derived from Bloomberg, Reuters, IDC, Markit, and TRACE. The majority of these market quotes represent an actual bid on the debt instrument, although no trade may have occurred at that price. Over the 1982-2010 period, the dataset consists includes post-default prices for roughly 6,000 defaulted instruments issued by over 2,700 defaulting corporations. Moody's makes the 1970-2010 credit rating, default, and recovery rate data used in this study available through its Default and Recovery Database (DRD).

---

<sup>18</sup> The accuracy ratio possesses the same information about discriminatory power as the area under the receiver-operator characteristics curve (AROC) and the Gini coefficient. Each measure quantifies rank rather than scale.
